

Welcome to Sulzer Metco Westbury

Sulzer Metco Thermal Spray's U.S. headquarters are located 30 miles east of downtown New York City in Westbury, NY. For the last 10 years this plant has been the primary U.S. manufacturing, development and distribution location for the division.

Sulzer Metco's U.S. headquarters in Westbury, NY.

Over the years, the site has been responsible for many of Sulzer Metco's most successful thermal spray technologies. It is currently the center of excellence for the engineering and development of Sulzer Metco's thermal spray gun technology and thermal spray materials. Furthermore, most of the thermal spray gun components, some thermal spray control systems and many strategically important thermal spray materials are manufactured in this plant.

Westbury also houses a Systems Integration Group, which is responsible for installing and supporting all the automated thermal spray systems in the Americas, and a Coating Solution Center Group, which is responsible for providing thermal spray application support for existing and new business development activities. Recently, a SUMEBore[®] production cell has been installed. The new installation offers the benefit of the plasma process to the automotive, heavy trucking and railway industries.

Sulzer Metco Westbury provides all support functions for the North American business activities including finance, information technology, environmental health, safety and human resource functions. It employs approximately 250 people—some of which have been with Sulzer Metco for many years—in various positions necessary to support all of its sales, technical, engineering, business and logistical functions.

The history and diversity of the people employed in Westbury and the products they maintain play an important role in Sulzer Metco's legacy and its ability to support and expand its large global customer base.
