Environmental Product Declaration - EPD
Environmental and economic life cycle performance including climate-related data

ZFn Pump
The pump characterized in this EPD is inherently configurable. Configuration and efficiency depend on customer specification. The data given below are illustrative and only valid for the defined parameters (see chapter Life cycle, coverage, assumptions, and exclusions).

Main applications:

Type:
Modular construction design. Manufactured in two casing pressure ranges with over 50 sizes and six bearing frames. Pump configured according to customer requirements.

Rated power:
230 kW

Manufacturer:
Sulzer Pumps, Germany

CPC classification:
4322

Components included:
- Pump including casing, baseplate, shaft, impeller, bearings
- Gearbox
- Motor
- Frequency inverter
- Piping system

Electricity mix considered for usage: France

Key economic and environmental indicators over life-cycle of 40 years

- Procurement: 3.81%
- Manufacturing: 0.15%
- Usage: 96.04%
- Procurement: 19.54%
- Manufacturing: 0.92%
- Usage: 79.54%
- Cast iron: 69.0%
- Alloyed / high alloyed steel: 30.0%
- Oil: 0.10%
- Others: <0.001%

1) e.g. varnishes, seals
Functional unit
The functional unit is defined as 1 kW hydraulic power of the pump at optimum efficiency.

Composition of the product
70% of the pump consists of low alloyed steel and 30% of high alloyed steel.

70% of the pump consists of low alloyed steel and 30% of high alloyed steel.

The indicated quantity of oil refers to the initial fill of the pump, the oil is replaced every second year after installation.

Remaining components such as paints and seals amount to less than 0.01% of the total weight and have as such been omitted.

1) Natural gas, butane, propane. 2) Including transportation to Sulzer. 3) Including transportation to customer. 4) Hydro power, solar power, wind power, biomass. 5) Including waste and waste water treatment. 6) Fully allocated to procurement. 7) Including credit from recycling of pump at end of life-time. 8) Imported as heat. 9) See p.3 of this EPD for more information.

The pump is used in France; therefore France’s energy mix was applied.

</tbody>
</table>

n.a.: not available/applicable, kW related to 230 kW rated power. 1) Emissions are dominated by emissions in usage from electricity consumption. 2) Ozone depleting substances are not in use at the manufacturing site. 3) No related substances used in production.

## Life-cycle – coverage, assumptions, and exclusions

### System boundary:

The EPD covers all relevant environmental aspects in relation to the life cycle phase diagram below.

The pump is assembled in Germany, and therefore Germany’s emissions factor for the electricity generating mix has been applied.

The packaging of the pump for transport to the customer is a wooden crate, which has been included.

**Usage / end of life** includes the usage and servicing of the product. It includes the production and disposal of spare parts and of oil.

The motor and frequency inverter are not part of the system. The electricity consumption of the pump has therefore been calculated assuming an efficiency of both to 100%.

The pump is used in France, so the French electricity mix was assumed.

4% of the total weight of the pump is typically replaced during the lifetime and includes bearings, seals, impeller, and wearing rings.

For recycling purposes, a credit of 50% of the initial materials burden to produce the pump has been assumed. This conservative assumption was based on the fact that the use of recycled steel saves between 47% and 65% of energy compared to virgin steel (Volkshausen 2003; Wuppertal-Institut 2008).

Spent oil is disposed as hazardous waste and incinerated accordingly; its environmental effects have been calculated based on factors from the Ecoinvent Database.

**Transportation** to Sulzer (depending on the location of the supplier, variously by truck, train, ship or airplane) is included in the procurement phase. Transportation to the customer following the manufacturing phase is by truck and transportation for service activities in usage is by van for service at the customer site, or by truck if the pump is serviced at Sulzer’s site. Transportation of the dismantled pump at the end of its working life is not considered.

**Allocation:** For manufacturing, data collected on the annual consumption of energy and water, emissions to air, waste water and waste production (from SEED) have been divided by the total number of pumps produced by the site to estimate the resource consumption per pump. For procurement and usage all resources, emissions, and wastes have been fully allocated to the pump.

**Referenced period for underlying data:** Data taken from the Sulzer SEED database and Ecoinvent database origin from the year 2009.

The construction of buildings, production machinery and transport infrastructure are all excluded.

Manufacturing and usage of the motor, frequency inverter, and the piping used to operate the pump are excluded from the functional unit.

**Procurement** includes the extraction of raw materials and production of semi-finished products, consumables, and energy by suppliers. Production data were converted into environmental effects via factors from the Ecoinvent Database; based on the component parts for this product as assembled by Sulzer.

The consideration of externally sourced parts has been limited to the casing, baseplate, shaft, impeller, motor, gearbox, and bearings; which together account for over 99% of the product weight.

Due to low masses or rates of usage, small components such as solvents, varnishes and plastics (for e.g. seals) have not been included.

**Manufacturing at Sulzer** covers all product manufacturing activities undertaken at the manufacturing site including engineering, welding, grinding, machining, painting and assembly. Data used are drawn from the yearly Sulzer SEED data collection which includes energy (e.g. electricity, natural gas, butane, propane, fuel oils, district heating, coal and coke etc.) water consumptions and waste water, emissions to air and waste production.

The energy used includes both manufacturing and on-site office activities. The emissions to air from the use of paints and solvents are included. However related consumption of the varnishes and paints are excluded. The environmental burden from waste and wastewater treatment has been calculated using factors from the Ecoinvent Database.

### System boundary

- **Procurement:** covers all product manufacturing activities undertaken at the manufacturing site including engineering, welding, grinding, machining, painting and assembly.
- **Manufacturing at Sulzer:** covers all product manufacturing activities undertaken at the manufacturing site including engineering, welding, grinding, machining, painting and assembly. Data used are drawn from the yearly Sulzer SEED data collection which includes energy (e.g. electricity, natural gas, butane, propane, fuel oils, district heating, coal and coke etc.) water consumptions and waste water, emissions to air and waste production.
- **Usage / end of life:** includes the usage and servicing of the product. It includes the production and disposal of spare parts and of oil.
- **Transport:** to Sulzer (depending on the location of the supplier, variously by truck, train, ship or airplane) is included in the procurement phase. Transportation to the customer following the manufacturing phase is by truck and transportation for service activities in usage is by van for service at the customer site, or by truck if the pump is serviced at Sulzer’s site. Transportation of the dismantled pump at the end of its working life is not considered.

### Allocation

- For manufacturing, data collected on the annual consumption of energy and water, emissions to air, waste water and waste production (from SEED) have been divided by the total number of pumps produced by the site to estimate the resource consumption per pump. For procurement and usage all resources, emissions, and wastes have been fully allocated to the pump.

### Referenced period for underlying data

- Data taken from the Sulzer SEED database and Ecoinvent database origin from the year 2009.
Applied load levels of pump during life cycle
The applied load levels are summarized in the table below. Based on expected usage characteristics advised by customers, the pump is expected to be operated at full load throughout its life.

<table>
<thead>

**Glossary**

**Life cycle assessment, LCA** is a management tool for appraising and quantifying the total environment impact of products or activities during the entire life cycle.

**Life cycle costs** are based on LCAs and cover the total costs of a product during the entire life cycle from the extraction of resources to the disposal of the product.

A **Functional Unit** is a concept that is used to compare the life cycle costs of different products on a like-for-like basis.

**CPC (Central Product Classification)** is a UN-based scheme for statistical division of product categories and service types.

**Ecoinvent Database** contains international industrial life cycle inventory data.

**Acidification** occurs through deposition of soluble sulphur and nitrogen compounds from agricultural and combustion processes. Acidification can be harmful to sensitive ecosystems.

**Eutrophication** is the often anthropogenic enrichment of bodies of water by nitrates and phosphates. This increases the growth of aquatic plants that deoxygenate water and outcompete other aquatic life.

**Global warming potential, GWP** is the potency of 1 kg of a gas as a radiative forcing agent relative to an emission of 1 kg of carbon dioxide over 100 years.

**Ozone depletion potential, ODPs** are calculated as the change that would result from the emission of 1 kg of a substance compared to that from the emission of 1 kg of CFC-11 (trichlorofluoromethane).

**Photochemical ozone creation potential, POCP** refers to the change in of ground level ozone concentration potentially caused by the emission of 1 kg of a gas compared to that from the emission of 1 kg of ethene.

**SEED** is the database that Sulzer uses to collect, validate, and report on social, economic, and ecological data.

**Sulzer Pumps**
Sulzer Pumps is a world leader in reliable products and innovative pumping solutions. The global network of modern manufacturing and packaging facilities together with sales offices, service centres and representatives located close to major markets provide fast responses to customer needs.

Sulzer Pumps has a long history of providing innovative pumping solutions to business partners in the following industries: Oil and Gas, Hydrocarbon Processing, Pulp and Paper, Power Generation, General Industry, Chemical Process Industry, Water and Wastewater.

All manufacturing sites operate business man-agement systems certified to ISO 9001, ISO 14001, and OHSAS 18001.

**Sustainability program of Sulzer**
Sustainability is a key factor for the success of Sulzer. The company is committed to creating long term economic value, while proactively assuming its social and environmental responsibility. Sulzer continuously assesses its sustainability activities. Extensive programs have been initiated to meet the expectations of Sulzer’s stakeholders.

**Applied standards and limitations**
The document was prepared based on the EPD General Program Instructions, the PCR for pumps for liquids, liquid elevators and mixers (4322), and the ISO 14025:2010 standard.

Environmental product declarations from different programs with different product category rules may not be comparable.

**Verification**
The EPD has been externally verified by Atkins Ltd, United Kingdom. The verification was undertaken in two sections: a review of the relevant documentation followed by a review of underlying data using a combination of a desk based review, a site visit and information exchange with Sulzer. This EPD has been verified against the updated PCR for Pumps for Liquids; Liquid Elevators and Mixers (CPC Class 4322), valid until 2014-12-05.
