Sulzer reserves the right to alter specifications due to technical developments!
1  Application areas
The submersible wastewater pumps of the AS series have been designed for the economical and reliable pumping of commercial and industrial sewage and can be installed dry or wet. They are suitable for pumping of the following liquids: clear and wastewater, for sewage containing solids and fibrous material faecal matter. The AS series is suitable for modern sewage installation systems.

ATTENTION The maximum allowable temperature of the medium pumped is 40 °C.

ATTENTION Leakage of lubricants could result in pollution of the medium being pumped.

1.1 Approvals
Electrical safety of the AS series is CSA and CSA(U) approved.

1.2 Explosion-proof approvals
Explosion-proof motors of the AS series have certification in accordance with Factory Mutual (FM) Class 1 Div. 1 Groups C and D (60 Hz, US), and ATEX 2014/34/EU [II 2G Ex db h IIB T4 Gb] (50 Hz).

Operation of units as explosion-proof execution:
In hazardous areas care must be taken that during switching on and operation of the pumps the pump section is filled with water (dry installation) or alternatively is submerged (wet installation). Other types of operation e.g. snore operation or dry running are not allowed!

NOTE! Ex protection method type c “Constructional Safety” and k “Liquid immersion” in accordance with EN ISO 80079-36, EN ISO 80079-37 are used.

Operation of explosion-proof submersible pumps in wet-well installation:
It must be ensured that the motor of the Ex submersible pump is always fully submerged during start-up and operation!

The temperature monitoring of the explosion-proof submersible pumps has to be carried out by bimetallic temperature limiters according to DIN 44 082 connected to a suitable release device which is certified in accordance with EC directive 2014/34/EU.

2  Safety
The general and specific health and safety guidelines are described in detail in the “Safety Instructions for Sulzer Products Type ABS” booklet. If anything is not clear or you have any questions as to safety make certain to contact the manufacturer Sulzer.

This unit can be used by children aged 8 years and above, and persons with reduced physical, sensory, or mental capabilities, or lack of experience and knowledge, when they have been given supervision or instruction concerning the safe use of the device and understand the hazards involved. Children must not play with the appliance. Cleaning and user maintenance should not be performed by children without supervision.

2.1 Particular comments on the use of explosion-proof pumps in explosive zones.
1. Explosion-proof submersible pumps may only be operated with the thermal sensing system connected.
2. Float switches and seal monitoring (DI) must be connected via an intrinsically safe electrical circuit, Protection Type EX (i), in accordance with IEC 60079-11.
3. Dismantling and repair of submersible explosion-proof motors may only be carried out by approved personnel in specially approved work shops.
2.2 Special conditions for safe use of S-type, explosion-proof motors.

1. The integral supply cable shall be suitably protected from mechanical damage and terminated within an appropriate termination facility.

2. Pump motors rated for use with 50/60 Hz sinusoidal supplies shall have the thermal protection devices connected in such a way that the machine is isolated from the supply in the event of the stator reaching 130 °C.

3. Pump motors rated for use with variable frequency or non-sinusoidal supplies shall have the thermal protection devices connected in such a way that the machine is isolated from the supply in the event of the stator reaching 100 °C for T4 classified machines, or 160 °C for T3 classified machines.

4. These motor units are not intended for user service or repair, any operation that may affect the explosion protection characteristics should be referred to the manufacturer. Repairs on flameproof joints may only be performed in accordance with the manufacturer's design specifications.

3 Technical data

Detailed technical information is available in the technical data sheet “Submersible Wastewater Pump Type ABS AS 0530 - 0841” which can be downloaded from www.sulzer.com > Products > Pumps > Submersible Pumps.

Maximum noise level ≤ 70 dB. This may be exceeded in certain circumstances.

3.1 Nameplate

We recommend that you record the data from the standard nameplate on the pump in the corresponding form below, and maintain it as a source of reference for the ordering of spare parts, repeat orders and general queries. Always state the pump type, item number and serial number in all communications.

5 Lifting

**ATTENTION!** Observe the total weight of the Sulzer units and their attached components! (see nameplate for weight of base unit).

The duplicate nameplate provided must always be located and visible close to where the pump is installed (e.g. at the terminal boxes / control panel where the pump cables are connected).

**NOTE!** Lifting equipment must be used if the total unit weight and attached accessories exceeds local manual lifting safety regulations.

The total weight of the unit and accessories must be observed when specifying the safe working load of any lifting equipment! The lifting equipment, e.g. crane and chains, must have adequate lifting capacity. The hoist must be adequately dimensioned for the total weight of the Sulzer units (including lifting chains or steel ropes, and all accessories which may be attached). The end user assumes sole responsibility that lifting equipment is certified, in good condition, and inspected regularly by a competent person at intervals in accordance with local regulations. Worn or damaged lifting equipment must not be used and must be properly disposed of. Lifting equipment must also comply with the local safety rules and regulations.

**NOTE!** The guidelines for the safe use of chains, ropes and shackles supplied by Sulzer are outlined in the Lifting Equipment manual provided with the items and must be fully adhered to.
6 Transport

⚠️ During transport the unit should not be dropped or thrown.

⚠️ The unit should never be raised or lowered by the power cable.

The unit is fitted with a lifting device to which a chain and shackle may be attached for transport purposes.

⚠️ Any hoist used must be adequately dimensioned for the weight of the unit.

All relevant safety regulators as well as general good technical practice must be complied with.

7 Set-up and installation

ATTENTION All relevant regulations covering sewage pumping installations, and where applicable, explosion-proof installations, must be complied with.

⚠️ The cable duct to the control panel should be made gas-tight by filling with foam after the power supply and control circuit cables have been laid.

⚠️ Particular attention must be paid to the safety regulations covering work in closed areas in sewage plants as well as good general technical practices.

7.1 Discharge line

The discharge line must be installed in compliance with the relevant regulations.

DIN 1986/100 and EN 12056 applies in particular to the following:

- The discharge line should be fitted with a backwash loop (180° bend) located above the backwash level and should then flow by gravity into the collection line or sewer.
- The discharge line should not be connected to a down pipe.
- No other inflows or discharge lines should be connected to this discharge line.

ATTENTION The discharge line should be installed so that it is not affected by frost.

Figure 5: Installation example, concrete sump

7.3 Electrical connection

⚠️ Before commissioning, an expert should check that one of the necessary electrical protective devices is available. Earthing, neutral, earth leakage circuit breakers, etc. must comply with the regulations of the local electricity supply authority, and a qualified person should check that these are in perfect order.

**ATTENTION** The power supply system on site must comply with local regulations with regard to cross-sectional area and maximum voltage drop. The voltage stated on the nameplate of the pump must correspond to that of the mains.

Suitably rated means of disconnection shall be incorporated in the fixed wiring by the installer for all pumps in accordance with applicable local National codes.

The power supply cable must be protected by an adequately dimensioned slow-blow fuse corresponding to the rated power of the pump.

⚠️ The incoming power supply, as well as the connection of the pump itself to the terminals on the control panel, must comply with the circuit diagram of the control panel as well as the motor connection diagrams, and must be carried out by a qualified person.

In pump stations/tanks potential bonding must be carried out in accordance with EN 60079-14:2014 [Ex] or IEC 60364-5-54 [non-Ex] (Regulations for the installation of pipe lines, protective measures in power plants).

All relevant safety regulators as well as general good technical practice must be complied with.

**ATTENTION** For use in the open air, the following regulations apply:
Submersible pumps used outdoors must be fitted with a power cable of at least 10 m length. Other regulations may apply in different countries. In all installations, the power supply to the pump must be via a residual current device (e.g. RCD, ELCB, RCBO etc.) with a rated residual operating current not exceeding 30 mA. For installations not having a fixed residual current device the pump must be supplied to the power supply through a portable version of the device.

All three phase pumps must be installed with motor starting and overload protective devices in the fixed wiring by the installer. Such motor control and protective devices must comply with the requirements of IEC standard 60947-4-1. They must be rated for the motor that they control, and wired and set/adjusted according to the instructions provided by the manufacturer.

⚠️ Risk of electrical shock. Do not remove cord and strain relief and do not connect conduit to pump.

The following components should be incorporated in the fixed wiring for all single phase pumps:

- Motor starting and/or running capacitor that complies with the requirements of IEC 60252-1 and rated as specified in the installation instruction. The capacitor shall be class S2 or S3.
- Motor contactor that complies with the requirements of IEC Standard 60947-4-1 and rated for the motor that it controls.

⚠️ This pump has not been investigated for use in swimming pools.

**NOTE** Please consult your electrician.

AS 50 Hz:
S12/2 D, S13/4 D, S17/2 D, S22/4 D, S26/2 D, S30/2 D, S10/4 W, S12/2 W

AS 60 Hz:
S10/4 D, S16/2 D, S13/4 D, S16/4 D, S17/2 D S18/2 D, S22/4 D, S25/4 D, S26/2 D, S30/2 D, S35/2 D

NOTE:
U, V, W = Live
PE = Earth
gr/yel = Green/yellow
blk = Black
br = Brown

ATTENTION
Explosion-proof pumps may only be used in explosive zones with the thermal sensors fitted (leads: FO, F1).

ATTENTION
It is important to use the correct capacitors with single phase pumps. Use of incorrect capacitors will lead to motor burn-out.

7.4 Checking direction of rotation

The safety hints in the previous sections must be observed!

When three phase units are being commissioned for the first time, and also when used on a new site, the direction of rotation must be carefully checked by a qualified person.

When checking the direction of rotation, the unit should be secured in such a manner that no danger to personnel is caused by the rotating impeller or by the resulting air flow. Do not place your hand into the hydraulic system!

The direction of rotation should only be altered by a qualified person.

When carrying out the direction of rotation check as well as when starting the unit pay attention to the START REACTION. This can be very powerful.
ATTENTION
The direction of rotation is correct if the impeller/propeller rotates in a clockwise manner when viewing down from the top of the placed unit.

ATTENTION
The start reaction is anti clockwise.

Figure 11: Rotor rotation

NOTE If a number of pumps are connected to a single control panel then each unit must be individually checked.

ATTENTION The mains supply to the control panel should have a clockwise rotation. If the leads are connected in accordance with the circuit diagram and lead designations, the direction of rotation will be correct.

7.4.1 Changing direction of rotation

The safety hints in the previous sections must be observed!

The direction of rotation should only be altered by a qualified person.

If the direction of rotation is incorrect then this is altered by changing over two phases of the power supply cable in the control panel. The direction of rotation should then be rechecked.

NOTE The direction of rotation measuring device monitors the direction of rotation of the mains supply or that of an emergency generator.

8 Commissioning

The safety hints in the previous sections must be observed!

In explosive zones care must be taken that during switching on and operation of the pumps, the pump section is filled with water (dry running) or alternatively is submerged or under water (wet installation). Ensure in this case that the minimum submergence given in the data sheet is observed. Other types of operation e.g. snore operation or dry running are not allowed.

Before commissioning, the unit should be checked and a functional test carried out. Particular attention should be paid to the following:
- Have the electrical connections been carried out in accordance with regulations?
- Have the thermal sensors been connected?
- Is the seal monitoring device (where fitted) correctly installed?
- Is the motor overload switch correctly set?
- Have the power and control circuit cables been correctly fitted?
- Was the sump cleaned out?
- Have the inflow and outflows of the pump station been cleaned and checked?
- Is the direction of rotation correct - even if run via an emergency generator?
- Are the level controls functioning correctly?
- Are the required gate valves (where fitted) open?
- Do the non-return valves (where fitted) function easily?
- Have the hydraulics been vented in the case of dry installed pumps?
- Has the volute been vented (see Sec. 8.5)?
9 Maintenance and service

⚠️ To avoid danger if the power cable is damaged, it must be replaced by the manufacturer or its service agent or a similarly qualified person.

⚠️ Before commencing any maintenance work the unit should be completely disconnected from the mains by a qualified person and care should be taken that it cannot be inadvertently switched back on.

⚠️ Servicing must only be carried out by qualified personnel.

⚠️ When carrying out any repair or maintenance work, the safety regulations covering work in enclosed areas of sewage installations as well as good general technical practices should be followed.

NOTE The maintenance hints given here are not designed for “do-it-yourself” repairs as special technical knowledge is required.

NOTE A maintenance contract with our service department will guarantee you the best technical service under all circumstances.

9.1 General maintenance hints

Sulzer submersible pumps are reliable quality products each being subjected to careful final inspection. Lubricated-for-life ball bearings together with monitoring devices ensure optimum pump reliability provided that the pump has been connected and operated in accordance with the operating instructions.

Should, nevertheless, a malfunction occur, do not improvise but ask your Sulzer Customer Service Department for assistance.

This applies particularly if the pump is continually switched off by the current overload in the control panel, by the thermal sensors of the thermo-control system, or by the seal monitoring system (DI). Regular inspection and care is recommended to ensure a long service life.

NOTE The Sulzer Service Organisation would be pleased to advise you on any applications you may have and to assist you in solving your pumping problems.

NOTE The Sulzer warranty conditions are only valid provided that any repair work has been carried out in Sulzer approved workshop and where original Sulzer spare parts have been used.

NOTE When carrying out repairs, only original spare parts supplied by the manufacturer should be used.

WARNING: ATEX- and FM-rated AS pumps are approved for use in hazardous locations. If an Ex-rated pump is serviced or repaired in a workshop that is not Ex-approved then it must no longer be used in hazardous locations. In that case the Ex nameplate must be removed and replaced by the standard nameplate, or where instead a standard and a secondary Ex nameplate is fitted to the pump the secondary nameplate must be removed.
9.2 Commentary on maintenance of lifting stations in accordance with EN 12056.

It is recommended that the lifting station be inspected monthly and its function checked.

In accordance with EN regulations, the lifting station should be maintained by a qualified person at the following intervals:

- in commercial premises every three months.
- in apartment blocks every six months.
- in a single family home once a year.

In addition we recommend that a maintenance contract be taken out with a qualified company.

9.3 Oil filling and changing

The oil chamber between the motor and the hydraulic section has been filled at manufacture with lubricating oil.

</tbody>
</table>

An oil change is only necessary if a fault occurs.

⚠️ Repair work on explosion-proof motors may only be carried out in authorized workshops by qualified personnel using original spare parts supplied by the manufacturer. Otherwise the Ex approvals are no longer valid. Detailed guidelines, instructions and dimensional drawings for the service and repair of Ex-approved pumps are in the AS Workshop Manual and must be adhered to.
9.4 Cleaning

If the pump is used for transportable applications then it should be cleaned after each usage by pumping clear water in order to avoid deposits of dirt and encrustation. In the case of fixed installation, we recommend that the functioning of the automatic level control system be checked regularly. By switching the selection switch (switch setting “HAND”) the sump will be emptied. If deposits of dirt are visible on the floats then these should be cleaned. After cleaning, the pump should be rinsed out with clear water and a number of automatic pumping cycles carried out.

9.5 Venting of the volute

After lowering the pump into a sump full of water, an air lock may occur in the volute and cause pumping problems. In that case, shake or raise and lower the pump repeatedly until resulting air bubbles cease to appear at surface level. If necessary, repeat this venting procedure.
