

The hidden side of reliability

It's not the gearbox that's noticed, it's the downtime.

Gearboxes rarely attract attention. Yet critical operations depend on them. When performance deteriorates or failure occurs, the impact extends far beyond the gearbox itself. Across the drive train, the effects can be felt in equipment performance, availability and operational continuity.

Restoring performance starts with understanding the cause. By combining condition monitoring, responsive field support and engineering-led refurbishment, Sulzer helps operators act earlier, respond faster and make more informed maintenance decisions.

Gearbox services

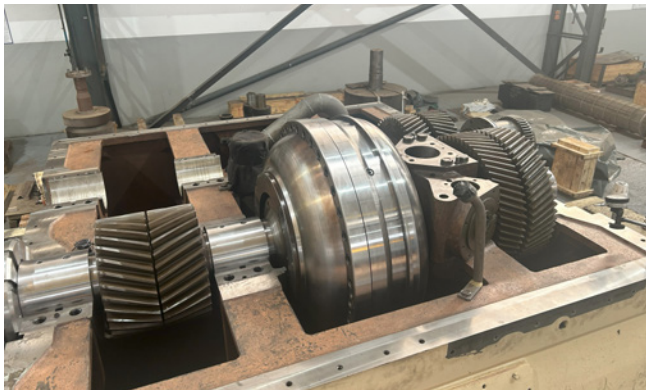

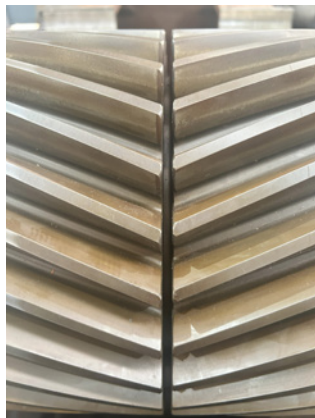

Supporting critical gearbox assets from diagnosis to return-to-service

Refurbishment solutions

Saving, not scrapping

Restoring value through engineering-led refurbishment, helping operators extend component life and avoid unnecessary replacement where practical:

- Gearbox refurbishment
- Strategic component sourcing
- Reverse engineering
- Re-metalling
- Shaft restoration and thermal spray repair

Condition monitoring

The gearbox is rarely the whole story

Many gearbox failures originate elsewhere in the drive train. Identifying developing issues and recurring failure patterns early can help prevent more significant failures later:

- Vibration and temperature analysis
- Oil, water and contamination analysis
- Alignment and drive-train assessment
- Wear trend analysis
- Reliability recommendations

Field service support

Every hour tells a story

Supporting operators with rapid assessment, troubleshooting and on-site expertise to help minimize downtime and accelerate recovery:

- On-site inspections
- Fault diagnosis and troubleshooting
- Alignment verification
- Installation and commissioning
