## Control System Type ABS PCx COMLI/Modbus

---

## Contents of the manual

1	COMLI AND MODBUS PROTOCOL .....	5
1.1	GENERAL INFO ABOUT COMLI: .....	5
1.1.1	<i>Build – up of Comli telegram:</i> .....	5
1.1.2	<i>Telegram structure:</i> .....	5
1.1.3	<i>BYTE 0: STX</i> .....	5
1.1.4	<i>BYTE 1 and 2: ID.No.</i> .....	5
1.1.5	<i>BYTE 3: STAMP</i> .....	5
1.1.6	<i>BYTE 4: MESSAGE TYPE</i> .....	6
1.1.7	<i>BYTE 5-8: START ADDRESS</i> .....	6
1.1.8	<i>BYTE 9 and 10: NUMBER DATA BYTES n.</i> .....	6
1.1.9	<i>DATA BYTES:</i> .....	6
1.1.10	<i>BYTE 11+n: ETX</i> .....	6
1.1.11	<i>BYTE 12+n</i> .....	6
1.2	MESSAGE TYPES .....	7
1.2.1	<i>MESSAGE TYPE '0':</i> .....	8
1.2.2	<i>MESSAGE TYPE '1':</i> .....	8
1.2.3	<i>MESSAGE TYPE '2':</i> .....	8
1.2.4	<i>MESSAGE TYPE '3':</i> .....	8
1.2.5	<i>MESSAGE TYPE '4':</i> .....	8
1.2.6	<i>MESSAGE TYPE 'I':</i> .....	8
1.2.7	<i>MESSAGE TYPE 'J':</i> .....	8
1.2.8	<i>MESSAGE TYPE 'K':</i> .....	8
1.2.9	<i>MESSAGE TYPE 'M':</i> .....	9
1.2.10	<i>MESSAGE TYPE 'Ä' (5D hex):</i> .....	9
1.2.11	<i>MESSAGE TYPE 'Å':</i> .....	9
1.2.12	<i>Message Type '&lt;':</i> .....	9
1.2.13	<i>Message Type '=':</i> .....	9
1.3	NOT STANDARDISED MESSAGE TYPES.....	9
1.3.1	<i>MESSAGE TYPE '?':</i> .....	9
1.3.2	<i>MESSAGE TYPE 'O':</i> .....	9
1.3.3	<i>MESSAGE TYPE '@':</i> .....	10
1.3.4	<i>MESSAGE TYPE 'P':</i> .....	10
1.4	GENERAL INFO ABOUT MODBUS .....	10
1.4.1	<i>Message functions:</i> .....	10
1.4.2	<i>Modbus cross-reference list:</i> .....	11
1.4.3	<i>Analogue logger read out</i> .....	11
1.4.4	<i>Max no of data in one message</i> .....	11
1.4.5	<i>User message functions</i> .....	11
1.4.6	<i>Function 65</i> .....	12
1.4.7	<i>Function 66</i> .....	12
1.4.8	<i>Function 67</i> .....	12
1.4.9	<i>Function 68</i> .....	14
1.4.10	<i>Function 69</i> .....	14
1.5	MODBUS MASTER: .....	15
1.6	EXTENDED RESOLUTION (32 BIT REGISTER): .....	15
1.7	REMOTE / LOCAL FUNCTION .....	15
1.8	PCx AS COMLI/MODBUS MASTER .....	15
1.8.1	<i>Trig of master function:</i> .....	16
1.8.2	<i>Configure analogue inputs for remote data:</i> .....	16
2	COMLI/MODBUS IO NUMBER LAYOUT: .....	17
2.1.1	<i>Digital outputs:</i> .....	17
2.1.2	<i>Pump status (P1-P16):</i> .....	17
2.1.3	<i>Remote control:</i> .....	17
2.1.4	<i>Digital inputs:</i> .....	18
2.1.5	<i>Pump pit valves ventiler:</i> .....	18
2.1.6	<i>One or more pumps in the pit are blocked trough alarm:</i> .....	18
2.1.7	<i>Pump pit status:</i> .....	18
2.1.8	<i>Comb alarm status:</i> .....	19
2.1.9	<i>Free user area:</i> .....	19
2.1.10	<i>Checkrun (F.707):</i> .....	19
2.1.11	<i>Shift motor:</i> .....	19
2.1.12	<i>User IO:</i> .....	19
2.1.13	<i>Status sequential week timer:</i> .....	19
2.1.14	<i>System info:</i> .....	19

2.1.15	<i>Alarm status:</i> .....	20
2.1.16	<i>Latched alarm status:</i> .....	20
2.1.17	<i>Acknowledged alarms:</i> .....	20
2.1.18	<i>Copies of Bitmask register for AquaProg:</i> .....	20
2.1.19	<i>Time stamp of IO-event:</i> .....	20
2.1.20	<i>Trig of Com. master communication:</i> .....	20
2.1.21	<i>Pump blocking at not ackn. Pump error alarms:</i> .....	20
2.1.22	<i>Setting of new IO status for sequential clock:</i> .....	21
2.2	<b>CROSS REFERENCE:</b> .....	21
2.3	<b>TEXT ADDRESSES:</b> .....	22
2.3.1	<i>Analogue Inputs</i> .....	22
2.3.2	<i>Analogue outputs</i> .....	23
2.3.3	<i>Digital inputs</i> .....	24
2.3.4	<i>Digital outputs</i> .....	26
2.3.5	<i>Flow and pulse texts</i> .....	27
2.3.6	<i>Set-point units for pumps</i> .....	28
2.3.7	<i>PID controller</i> .....	28
2.3.8	<i>Shift motor</i> .....	28
2.3.9	<i>Texts for key 6 data</i> .....	28
2.3.10	<i>Tele and alarm set-up</i> .....	29
2.3.11	<i>GPRS modem status</i> .....	31
2.3.12	<i>Actual display text:</i> .....	31
2.3.13	<i>Alarm text:</i> .....	31
2.3.14	<i>IO texts:</i> .....	31
2.3.15	<i>Digital history time stamped events in chronological order</i> .....	32
2.3.16	<i>Digital history time stamped events in numerical order</i> .....	32
2.3.17	<i>Log texts: Only readable</i> .....	32
3	<b>PCX COMLI /MODBUS REGISTER</b> .....	34
3.1.1	<i>Remote / Local status</i> .....	34
3.1.2	<i>Analogue status 0-65535 for scaled range</i> .....	34
3.1.3	<i>Sequence timer, current data value</i> .....	35
3.1.4	<i>No of pumps / pump pit</i> .....	35
3.1.5	<i>Actual volume in pump pit</i> .....	35
3.1.6	<i>Alarm status</i> .....	36
3.1.7	<i>Actual values in engineering units</i> .....	36
3.1.8	<i>Information about analogue log data</i> .....	37
3.1.9	<i>Reserved for data from UCP/UCC</i> .....	37
3.1.10	<i>Local signal to UCPCOM</i> .....	37
3.1.11	<i>No of pumps running</i> .....	37
3.1.12	<i>Current motor speed for PID controlled pump groups</i> .....	37
3.1.13	<i>Analogue inputs in engineering units, according to A.in. set-up</i> .....	37
3.1.14	<i>Real time clock</i> .....	38

3.1.84	IO-trig of Com. master.....	213
3.1.85	Time stamp IO-signals .....	214
3.1.86	Power Save modes .....	216
3.1.87	Dial up Alarms, delay of ID transmission to LC-Translator system.....	216
3.1.88	Alarm blocking in local mode .....	216
3.1.89	Pause time, Set points and motor current pump 1-16.....	216
3.1.90	Set points for analogue output signal IO module 1-8 .....	218
3.1.91	Pump blocking in sedimentation pit From V. 1.13.....	220
3.1.92	Timer reset set points for level rise time when 0 Pumps running .....	220
3.1.93	Timer reset set points for level rise time when 1 Pump running .....	221
3.1.94	Timer reset set points for level rise time when 2 Pumps running .....	221
3.1.95	Turn setpoint off for blocked pumps (F.706) .....	221
3.1.96	P-band for speed pumps pump group 1 (If F.610=ON P-BAND).....	221
3.1.97	P-band for speed pumps pump group 2.....	221
3.1.98	Unconditional pump set-up .....	221
3.1.99	Settings speed pump PID group 1 From V. 1.15 .....	221
3.1.100	Settings speed pump PID group 2 From V. 1.15.....	221
3.1.101	Settings pressure boost pump group 1 From V. 1.15.....	222
3.1.102	Settings pressure boost pump group 2 From V. 1.15.....	222
3.1.103	Additional configuration pump pit 1 .....	222
3.1.104	Additional configuration pump pit 2 .....	222
3.1.105	Additional configuration pump pit 3 .....	222
3.1.106	Additional configuration pump pit 4 .....	222
3.1.107	Set-up timer 9 (week timer) .....	222
3.1.108	Speed pump controlled pump pit 1 (PID reg.) .....	223
3.1.109	Speed pump controlled pump pit 2 (PID reg.) .....	223
3.1.110	Extended no of values in main menu (toggle) .....	223
3.1.111	Limited total no of pumps in 2 pits .....	223
3.1.112	Shift motor 1 Se also reg. 10146-10187 for shiftmotor 3-4.....	223
3.1.113	Shift motor 2 .....	224
3.1.114	IO controlled register data 1-16 .....	224
3.1.115	Set-up of week times timer 1 (Pump pit) .....	226
3.1.116	Set-up of week times timer 2 (Pump pit) .....	226
3.1.117	Set-up of week times timer 3 (Pump pit) .....	227
3.1.118	Set-up of week times timer 4 (Pump pit) .....	227

3.1.119	Sequence event timer, new IO-status for event 1-64 (Duplicated on IO 6272-6335).....	227
3.1.120	Sequence timer event 1-64.....	227
3.1.121	GPRS Options.....	234
3.1.122	Com port configuration Com 1 .....	234
3.1.123	Com port configuration Com 2.....	234
3.1.124	Set-up to handle with care on Com 1 (Communication might drop) .....	235
3.1.125	Set-up to handle with care on Com 2 (Communication might drop) .....	235
3.1.126	Port status Com 1 (for Swedmeter) .....	235
3.1.127	Port status Com 2 (for Swedmeter) .....	235
3.1.128	Alarm dialling status .....	235
3.1.129	Database status time stamped events.....	235
3.1.130	Com status time stamped events Com 1 .....	235
3.1.131	Com status time stamped events Com 2 .....	235
3.1.132	Ram bank status (For Swedmeter) .....	236
3.1.133	Status sedimentation pit .....	236
3.1.134	No of values in logfiles from midnight .....	236
3.1.135	Ackumulated runningtime in minutes, modulo 10000 (Uni view) .....	236
3.1.136	Ackumulated overflow time in minutes, modulo 10000 (Uni view).....	236
3.1.137	Alternator position .....	236
3.1.138	Duplicate of IO numbers for LED config. of digital signals .....	237
3.1.139	Help for AquaProg to select pump control source.....	237
3.1.140	Sequence timer set-up .....	238
3.1.141	Key 6 user parameter 1-24.....	240
3.1.142	Check run of pump 1-16 .....	243
3.1.143	Allowed pumpinterval for manouver on level derivata PP 1 (see also reg. 9200).....	245
3.1.144	Allowed pumpinterval for manouver on level derivata PP 2 (see also reg. 9204).....	245
3.1.145	Allowed pumpinterval for manouver on level derivata PP 3 (see also reg. 9208).....	245
3.1.146	Allowed pumpinterval for manouver on level derivata PP 4 (see also reg. 9212).....	245
3.1.147	Analogue log set-up log channels 20-31 .....	245
3.1.148	Monitoring of the power supply voltage level IO-Modul 1-8 with alarm.....	248
3.1.149	Cross-referens and dial signals COM Port 3-8 .....	248
3.1.150	Protocol and settings Com 3-8 .....	249
3.1.151	Modbus master messages 1-127.....	250
3.1.152	Ramp times for Analogue outputs.....	266
3.1.153	Analogue log channel 20-31, number of values in the expanded historic data.....	266
3.1.154	Analogue log channel 0-31, Selection of the day in the exp. hist. data .....	267
<b>4 APPENDICS.....</b>		<b>268</b>
<b>4.1 SCALABLE CROSS REFERENCE: .....</b>		<b>268</b>
<b>4.2 ALARM ACKNOWLEDGEMENT FOR PUMP RESTART:.....</b>		<b>268</b>

4.8.6 Parameters for digital output function "Spray" (Type 14).....		272
4.8.7 Parameters for digital output function "Comli IO-bit" (Type 15) .....		272
4.8.8 Parameters for digital output function "Logic IO" (Type 16).....		272
4.8.9 Parameters for digital output function "Flow pulse from flow meter" (Type 17).....		272
4.8.10 Parameters for digital output function " Flow pulse from pulse flow " (Type 18) .....		272
4.8.11 Parameters for digital output function " Flow pulse from pump flow " (Type 19) .....		272
4.8.12 Parameters for digital output function "Timer" (Type 20).....		272
4.8.13 Parameters for digital output function "Set point" (Type 21).....		272
4.8.14 Parameters for digital output function "Speed pump" (Type 22).....		272
4.8.15 Parameters for digital output function "Compare register data" (Type 25) .....		273
4.8.16 Parameters for digital output function "Setpoint window" (Type 26) .....		273
<b>4.9 DIGITAL INPUT PARAMETERS .....</b>		<b>273</b>
4.9.1 Parameters for digital input function "Hold output" (Type 17).....		273
4.9.2 Parameters for digital input function "Force output" (Type 18) .....		273
4.9.3 Parameters for digital input function "Block derivata control" (Type 24) .....		273

## **1 COMLI and Modbus Protocol**

### **1.1 General info about COMLI:**

The Comli Protocol consists of a number of different telegram types for data exchange between central unit and sub units in a MASTER / SLAVE dependence.

MASTER / SLAVE means that the central unit always is MASTER which means that all communication with sub units is controlled by the central unit.

Each sub unit has its own identification number, which means that communication with several sub units can be made via the same cable if so called. multi-drop modem is used.

#### **1.1.1 Build – up of Comli telegram:**

A Comli telegram can at most contain 77 signs (bytes) of which 64 data bytes and 13 order and control bytes. This is valid for both binary and ASCII data.

Most telegrams exchange data as 16 bit integer either binary (2 bytes / data register), or ASCII hexadecimal (4 bytes / data register), which means that each telegram can contain max. 32 data register in binary mode or 16 data register in ASCII mode.

Each telegram is started with STX (ASCII code 2) followed by 2 bytes for the identification number of the sub unit, 1 so called. stamp byte as described below,  
1 byte for message type,  
4 bytes for start address,  
2 bytes for number of data signs,  
0-64 bytes data,  
and ETX ( ASCII code 3) and 1 byte checksum.

#### **1.1.2 Telegram structure:**

0	1	2	3	4	5	6	7	8	9	10	D1	Dn	Dn+1	Dn+2
STX	ID. No.	STAMP	MSG.	START	ADDRESS	NUMBER(n)	DATA	0-	DATA	0-	ETX	CHK.		

Byte 1 - 10 is always Hexadecimal ASCII, for ex.. ID.No. 1 is sent as ‘0’’1’ (Hex), ID.No. 10 = ‘0’’A’(Hex).

#### **1.1.3 BYTE 0: STX**

Telegram start. (ASCII code 2)

#### **1.1.4 BYTE 1 and 2: ID.No.**

Identification number of sub unit (1-255) in ASCII hex format.

Number 0 is always master (Central unit).

Sub unit only answers if the number corresponds to own number.

#### **1.1.5 BYTE 3: STAMP**

Can be ‘0’, ‘1’, or ‘2’.

The Central unit shall send ‘0’ when starting and thereafter change between ‘1’ and ‘2’ for each telegram so that the sub unit will know if the telegram is re-sent (Used by Satt PLC).

PCx answers with same stamp as in request.

### **1.1.6 BYTE 4: MESSAGE TYPE**

Can be '0'-'9' and 'A'-'V'.

See separate description for used message types.

### **1.1.7 BYTE 5-8: START ADDRESS**

Gives start address to first data register in the telegram. Always hex ASCII '0''0''0''0' to 'F''F''F''F'.

See separate address list.

### **1.1.8 BYTE 9 and 10: NUMBER DATA BYTES n**

Tells how many data bytes that follow when transmitting data, or how many bytes shall be transferred when asking for data. Always hex ASCII.

### **1.1.9 DATA BYTES:**

Binary or ASCII hex. PCx supports only binary format.

Max 16 register values / telegram with hex ASCII.

Max 32 register values binary.

When binary communication one byte is always 8 data bits. High byte (M.S.Byte) in register is sent before low byte (L.S.Byte).

NOTE! For a byte of binary data, most significant bit (M.S.B.) is sent first and least significant bit (L.S.B.) last, i.e. opposite to normal ASCII communication.

### **1.1.10 BYTE 11+n: ETX**

Ends telegram.

### **1.1.11 BYTE 12+n**

CHECKSUM BCC (Block Check Count) Calculated as a modulo-2 addition (XOR) on all bytes in the telegram except first STX sign, inclusive ETX.

More information is available in Comli specification from Alfa Laval (ex. Satt Control).

## 1.2 Message types

As most Central systems only use a limited choice of the available message types at Comli emulation, only the most common types are used even in PCx as below. For detailed information we refer to Alfa Laval's Comli manual.

0	Transfer of register value or. IO-RAM status.
1	Confirmation data received.
2	Request for register value or. IO-RAM status.
3	Transfer of status for one IO-bit.
4	Request of status for one IO-bit.
I	Request for date and time.
J	Transfer of date and time
K	Request of memory content 0-64 Kbytes
M	Transfer of memory content 0-64 Kbytes
Å	Request for time stamped IO events.
Ä	Transfer of time stamped IO events.
<	Request of extended register (65535 registers can be addressed).
=	Transfer of extended register value.

General message type for text is not defined in Comli, why we have chosen two free types according to Satt Controls Comli documentation.

Message types 'O' and 'P' were defined as not used in Satt Controls Comli manual when they initially were implemented for text transfer.

Message type 'O' and 'P' have later been defined for floating point numbers by Alfa Laval why we doubled these types

With telegram type '?' and '@'. In later versions type 'O' and 'P' will not be used, but are still in use for

Comparability with older units

O and ?	Request for text (Not used in Satt Control Comli specifications)
P and @	Transfer of text (Not used in Satt Control Comli specifications)

For communication between PCx and other systems there is a possibility for software configuration of reg. 0-254 (255 register), which can be set to all registers which are described in register list

### 1.2.1 MESSAGE TYPE '0':

Transfer of register value or. IO-RAM status. Sent from central system to PCx for transfer of register value or from PCx as answer on request for data or IO-status.

Address 0000h - 3FFFh used for transfer of IO-status.

Address must be dividable by 8.

At binary communication each byte contains information of 8 digital IO-numbers. Max 512 IO bits per telegram.

Address 4000h - FFFFh is used for transfer of register values.

The address must be dividable with 16.

Register is from 0 - 3071 (Max number Comli registers = 3072), whereby the Comli address will be

Register no. \* 16 + 16384 (reg.no \* 10h + 4000h).

### 1.2.2 MESSAGE TYPE '1':

Confirmation data received.

Sent from PCx to central system as confirmation that transferred data from central system is received.

### 1.2.3 MESSAGE TYPE '2':

Request of register value or. IO-RAM status.

Sent from central system to PCx.

Address 0000h - 3FFFh used for request of IO-status.

The address must be dividable with 8. Using Hex ASCII each byte represents 4 IO. digital in- or outputs (each bit = 1 IO-channel). Max 256 IO bits per telegram.

Using binary communication each byte contains information of 8 IO. digital IO-signals. Max 512 IO bits per telegram.

Address 4000h - FFFFh used for request of register values.

Same conditions as for message type 0.

### 1.2.4 MESSAGE TYPE '3':

Transfer of status for one IO-bit. Sent from central system to PCx or from PCx as answer on request about status for one IO-bit.

### 1.2.5 MESSAGE TYPE '4':

Request of status for one IO-bit.

Sent from central system to PCx.

### 1.2.6 MESSAGE TYPE 'I':

Request for date and time.

Sent from central system to PCx.

### 1.2.7 MESSAGE TYPE 'J':

Transfer of date and time.

Sent from central system to PCx or from PCx as answer on request about date and time.

### 1.2.8 MESSAGE TYPE 'K':

Request about memory content 0-64 Kbytes.

Sent from central system to PCx.

Used for request of compressed history data.

### 1.2.9 MESSAGE TYPE 'M':

Transfer of memory content 0-64 Kbytes.

Sent from PCx to central system.

Used for transfer of compressed historic logdata.

### 1.2.10 MESSAGE TYPE 'A' (5D hex):

Request for time stamped IO events.

Sent from central system to PCx.

Used for requests of Alarm and/or IO history.

### 1.2.11 MESSAGE TYPE 'A':

Transfer of time stamped IO events.

Sent from PCx to central system.

Sends up to 6 time stamped IO events / telegram. Where after sent data are flagged off , and next telegram contains new data. (Each event can only be transferred once.)

### 1.2.12 Message Type '<':

Request of expanded register value. Up to 65535 registers can be addressed.

The central system sends this to the PCx

### 1.2.13 Message Type '=':

Transmitting an expanded register value. The central systems sends this to the PCx when transmitting an expanded register value to or receiving from the CPU30 as answer of a data request.

## 1.3 Not standardised message types

Message types 'O' and 'P' were defined as not used in Satt Controls Comli manual when they were introduced for transfer of text.

Message type 'O' and 'P' have later been defined as floating point by Alfa Laval so these types have been doubled with message types '?' and '@'. In coming versions type 'O' and 'P' will not be used. Used at present for comparability

### 1.3.1 MESSAGE TYPE '?':

### 1.3.2 MESSAGE TYPE 'O':

Request for text.

Sent from central system to PCx, for request of text.

Fixed number of data bytes:

PCx returns a string with requested number of data bytes. If string is shorter than requested number of bytes PCx fills with spaces up to requested number. If string is longer only the requested number of data bytes will be transferred.

Variable number of data bytes:

If requested number of data bytes is set to 0 , PCx returns the whole text string with the number of data bytes in response telegram set to number of bytes in the string.

Largest number of data bytes in the string in PCx is 64 bytes = max. message length for 1 telegram at binary data transfer.

### 1.3.3 MESSAGE TYPE '@':

### 1.3.4 MESSAGE TYPE 'P':

Transfer of text.

Sent from central system to PCx. for transfer of text string, or from PCx to central system. As answer on request for text.

At transfer from central system PCx answers  
with confirmation that data is received (message type 1)

On request from central system PCx returns text string with requested number of data bytes.

(Short strings fills with 'space'.)

(Long strings can be cut.)

If requested number of data bytes is set to 0 the whole string is returned, with the number of data bytes in the response telegram set to actual number of data bytes.

## 1.4 General info about Modbus

Modbus is a Master/Slave protocol in the same manner as Comli with possible multidrop connectivity.  
For data exchange a number of message functions is available for 16-bit data registers and IO-status.  
PCx supports Modbus RTU for binary data.

### 1.4.1 Message functions:

Following Modbus functions is supported by PCx

- |    |                           |
|----|---------------------------|
| 01 | Read coil status          |
| 02 | Read input status         |
| 03 | Read holding register     |
| 04 | Read input register       |
| 05 | Force single coil         |
| 06 | Preset single register    |
| 15 | Force multiple coils      |
| 16 | Preset multiple registers |

Modbus have separate message functions for read out of input and output status.  
Only outputs can be written.

In PCx, data is digital IO status (0/1), or data registers (numerical values).  
Message type 1 (coil status) and 2 (input status) addresses the same data in PCx.  
Also message type 3 (holding registers) and type 4 (input registers) addresses the same data in PCx.

In monitoring systems with Modbus protocol, data is normally separated in series starting with 1 as first reference number and a leading digit to specify data type.

MODBUS DATA		REFERENCE NAME IN PCx
COIL	0001	IO 0
COIL	0002	IO 1
a.s.o.		
INPUT	10001	IO 0
INPUT	10002	IO 1
a.s.o.		

### OUTPUT HOLDING

#### REGISTER:

40001

Register 0

40002

Register 1

a.s.o.

### INPUT

#### REGISTER:

30001

Register 0

30002

Register 1

a.s.o.

### 1.4.2 Modbus cross-reference list:

Cross-reference list is valid for reading data with message function 3 (holding registers).

Function 4 (input registers) ignores the cross-reference list (data is always according to the register manual).

For data writes, the cross-reference list is valid for message function 6 and 16.

Function 70 ignores the cross-reference list.

### 1.4.3 Analogue logger read out

Compressed log data is read out with message function 3 or 4 from address 8000H.

Expanded log data is read out with message function 3 or 4, address 4000H-7FFFH.

### 1.4.4 Max no of data in one message.

Max no of data that can be transferred in one Modbus message differs between manufacturers and types.

PCx have following limits.

Function:	Description:	Max no of data in one message:
01	Read coil status	2000 Coils
02	Read input status	2000 Inputs
03	Read holding register	125 Registers
04	Read input register	125 Registers
05	Force single coil	1 Coil
06	Preset single register	1 Registers
15	Force multiple coils	1024 Coils
16	Preset multiple registers	100 Registers
70	Preset multiple registers	100 Registers

If address range exceeds limits, PCx will return Error Response "illegal data address", code 2.

For not supported message functions, PCx will return Error Response "illegal function", code 1.

### 1.4.5 User message functions

In Modbus, message type 65 – 72 is reserved for user functions.

For AquaProg support, the following message functions are added.

65 'A' = Request of text

66 'B' = Transfer of text

67 'C' = Request of date and time

## Comli/Modbus register

## 68 'D' = Transfer of date and time

69 'E' = Request of time stamped events

70 'F' = Preset multiple registers ignoring cross reference list (otherwise same as message function 16)

## 1.4.6 Function 65

Request of text. Max string length = 64 characters

## Response from slave

Slav	Byte	Text	Text	Text	CRC	CRC	
adr.	Func	Cnt	Data	Data	Data	Hi	Lo
1	65	3	'A'	'B'	'C'	x	x

If requested Qty = 0, the full string will be returned with Byte Cnt set to actual no of characters.

If Qty = 1-64, requested no of bytes will be returned.

Longer strings will be truncated to requested no of bytes.

Short strings will be padded with trailing spaces up to requested no of bytes.

If requested no of bytes > 64, error code 2 (Illegal data address) will be returned.

### 1.4.7 Function 66

Transfer of text. Max string length = 64 characters

#### Response from slave

If requested no of bytes > 64, error code 2 (Illegal data address) will be returned.

### 1.4.8 Function 67

Request of date and time. Fix string length = 12 characters

Address is always 0

Qty. is normally 0 or 12

#### Response from slave

Slav	Byte	Text	CRC	CRC												
adr.	Func	Cnt	Data	Hi	Lo											
1	65	12	'0'	'0'	'0'	'6'	'3'	'0'	'2'	'3'	'5'	'8'	'5'	'9'	x	x

Time is returned as a text string "YYMMDDHHMMSS"

If requested Qty = 0, Byte Cnt is set to 12 characters.

If Qty = 1-64, requested no of bytes will be returned.

Longer strings will be truncated to requested no of bytes.

Short strings will be padded with trailing spaces up to requested no of bytes.

If requested no of bytes > 64, error code 2 (Illegal data address) will be returned.

### 1.4.9 Function 68

Transfer of date and time. Fix string length = 12 characters

Address is always 0

Qty. and Byte Cnt is always 12

#### Response from slave

Slav		Adr.	Adr.	Qty.	Qty.	CRC	CRC	
adr.		Func	Hi	Lo	Hi	Lo	Hi	Lo
1	68	0	0	0	12	x	x	

Qty. or Byte Cnt differs from 12, error code 2 (Illegal data address) will be returned.

### 1.4.10 Function 69

Request of time stamped events. Fix string length = 60 characters (6 events)

Slav		Adr.	Adr.	Qty.	Qty.	CRC	CRC
adr.	Func	Hi	Lo	Hi	Lo	Hi	Lo
1	69	0	0	0	6	x	x

Address is always 0 for a new request.

In case of com. error, retransmit of previous data is done if address = 1.

Qty is always 6 events (\* 10 bytes/event = 60 bytes)

#### Response from slave

Slave		Byte	Event 1		Event 6		CRC	CRC
adr.	Func	Cnt	Data		Data	Hi	Lo	
1	69	60	0	0	9	x	x	
60 bytes event data								

If Qty. Differs from 6, error code 2 (Illegal data address) will be returned.

Byte Cnt is always 60 bytes.

Event data have the same layout as in Comli message Å-Ä.

### 1.5 Modbus master:

PCx support following message functions as Modbus master.

Type:	Function:
1	Read coil status
2	Read input status
3	Read holding registers
4	Read input registers
5	Force single coil
6	Preset single holding register
16	Preset multiple holding registers

Message function 1 and 2 addresses the same IO data in PCx.

Message function 3 and 4 addresses the same register data in PCx.

### 1.6 Extended resolution (32 bit register):

A register in Comli/Modbus is normally 16 bit. As certain values demand a better resolution (long int = 32 bits) these values are split into 2 data registers where the most significant register is sent first, these registers are shown with 2 register numbers in the data register list.

It is very seldom that more than 16 bit resolution is exceeded. If the system can handle only 16 bit registers the higher register value (l.s.w.) shall be used.

To calculate the 32-bit value the normal operation is to read both registers as 16 bit data.

The 32-bit value is calculated in a math block as the lower register number content \* 65536 + the higher register number content.

**Example:** Accumulated runtime (seconds) for Pump 1 is found in register 592+593.

Data in register 592 = 5 and 593 = 32320.

Runtime = 5 \* 65536 + 32320 = 360 000 seconds (100 hours).

### 1.7 Remote / Local function

The task of this function is to prevent external manoeuvres via Comli/Modbus when there is service personal in the station.

Control of remote/local is done via a digital input.

In local position the PCx will not accept that data is set via Comli/Modbus, except for register 333 (Alarm acknowledgement). The address in the Comli/Modbus telegram must start on this register to be accepted.

### 1.8 PCx as COMLI/MODBUS master

Communication between several PCx.

Often there is a need to remotely block a pumping station from another pumping station if an error occurs.

To be able to control a function like this the PCx can occasionally act as master in the system.

Up to 8 other Comli/Modbus slaves can be addressed from the master PCx, via telephone or fixed line, mixed.

The Master function is activated by timer or IO event. In-between the PCx works as a normal slave unit.

**NOTE!** Only one master is allowed on a fixed line.  
If a central system is connected this normally is the master.

Up to 8 master channels can be set where Comli/Modbus slave identity and ev. tel. no. Are set for each channel.

At dial up communication a recall is made after 10 min if the first call failed, if even this call fails an alarm is sent and the calling is stopped until a new trig condition occurs.

Up to 127 Comli messages can be set up and 127 Modbus messages..

For each message is stated:

**IO type:** which can be following for Comli.

Closed.	(message type 0 - 3).
Digital IO.	Reg. 0-3071 (message type '0' and '2').
Standard Comli register.	Same as standard but gives scaling possibilities.
Cross ref. register.	See appendices about scaleable Cross reference.

Extended Comli register. Reg. 0-65535 (message type '<' and '=').

**Local IO or register no for IO types:**

**Read/write:** "Read from" or "Write to" slave

**Master channel:** 1-8. controls which slave is to be in communication .

**IO or register no. at Slave :**

The master handler checks the messages in number order (1-127) and where it is possible several messages are sent in one telegram. To limit the number of telegrams, the data, which are in sequence in a slave should be in sequence in the master configuration.

When error in the communication the telegram is resent. Failure in re-sending the message the communication is stopped for actual channel and alarm for communications sent.

A new attempt is made when the master communication is triggered again.

## 1.8.1 Trig of master function:

Under configuration of master channel the required time interval is given separately for each master channel. If 0 is set the timer function is disabled.

Further each IO-number between 0-999 can be set to trigger the master communication each time the status for the IO-number is changed.

IO-trig affects always all master channels.

## 1.8.2 Configure analogue inputs for remote data:

With the marker in position for SETTINGS in Analogue inputs the choice "IO-SIGNAL" can be found with the arrow keys. Choose "COMLI/MODBUS IO" and set the register number which contains the required remote data.

For communication with other data register 241-248 and 1960 - 1999

Are free to be used with integer data, and 2000 - 2047 for long data (double register).

NOTE! If the higher register number (Low Word) in a double register is set even data in the register before (High Word) be used by the analogue input.

Data collected from the slave are placed in reg. 1960 - 1999 or 2000-2047 depending on if 16 or 32 bits data content and scaling is set for range of collected data.

If an older UCC-UCP sends data, register 241-246 is used for Analogue in 1-6, and 247-248 for analogue out 1-2 by the older UCC-UCP.

The data interval is 0 - 20000 or 4000 - 20000 depending on sensor signal (older UCC-UCP sends actual mA signal).

Where it is possible it is recommended to use the extended telegram type to avoid conflicts in the cross- reference tables.

## 2 COMLI/MODBUS IO number layout:

PCx Max. 8 IO-modules

### 2.1.1 Digital outputs:

Digital Output	DO1	DO2	DO3	DO4	DO5	DO6	DO7	DO8
IO-module 1	0	1	2	3	4	5	6	7
IO-module 2	8	9	10	11	12	13	14	15
IO-module 3	16	17	18	19	20	21	22	23
IO-module 4	24	25	26	27	28	29	30	31
IO-module 5	32	33	34	35	36	37	38	39
IO-module 6	40	41	42	43	44	45	46	47
IO-module 7	48	49	50	51	52	53	54	55
IO-module 8	56	57	58	59	60	61	62	63

### 2.1.2 Pump status (P1-P16):

Pump	P1	P2	P3	P4	P5	P6	P7	P8	P9	P10	P11	P12	P13	P14	P15	P16
Pump running indication *1	64	65	66	67	68	69	70	71	72	73	74	75	76	77	78	79
Pump Relay *1	80	81	82	83	84	85	86	87	88	89	90	91	92	93	94	95

Pump valve status *6	208	209	210	211	212	213	214	215	216	217	218	219	220	221	222	223
End position valve closed	224	225	226	227	228	229	230	231	232	233	234	235	236	237	238	239
End position valve open	240	241	242	243	244	245	246	247	248	249	250	251	252	253	254	255
Start float	896	897	898	899	900	901	902	903	904	905	906	907	908	909	910	911
Stop float	912	913	914	915	916	917	918	919	920	921	922	923	924	925	926	927
Alarm blockad *7	928	929	930	931	932	933	934	935	936	937	938	939	940	941	942	943
Actual speed cont. pump *8	944	945	946	947	948	949	950	951	952	953	954	955	956	957	958	959

### 2.1.3 Remote control:

\* Remote control of pump related IO numbers. Control is also possible by writing direct to digital outputs, with corresponding configuration.

\*1 Remote control possible. Local conditions will always override remote control. Write 1 to start the pump, 0 to stop.

\*2 Pump reverse is activated by writing 1. Reset to 0 by PCx when sequence is done.

\*3 Reset sequence is activated by writing 1 (Resets retry counter to zero). Writing 0 stops sequence running.

\*4 Write 1 to stop the pump. 0 is ignored.

\*5 Resets to zero by PCx when local control conditions take place.

\*6 Pump valve always follows pump status, no separate control is possible.

\*7 See appendix about "Alarm acknowledgement for restart of pumps".

\*8 Remote manoeuvre for change of speed reg. pump is done by setting required pump to 1, whereby same sequence as by local change with F.630 is made.

**2.1.4 Digitala inputs:**

Digital input	DI1	DI2	DI3	DI4	DI5	DI6	DI7	DI8	DI9	DI10	DI11	DI12	DI13	DI14	DI15	DI16
IO-modul 1	256	257	258	259	260	261	262	263	264	265	266	267	268	269	270	271

**2.1.5 Pump pit valves ventiler:**

	PP.1	PP.2	PP.3	PP.4
Valve status:	384	385	386	387
End position closed:	392	393	394	395
End position open:	400	401	402	403

**2.1.6 One or more pumps in the pit are blocked trough alarm:**

Pump(s) alarm blocked      408      409      410      411\*

See appendices about "Alarm acknowledgement for restart of pumps".

**2.1.7 Pump pit status:**

	PP.1	PP.2	PP.3	PP.4
Sensor error	432	440	448	456
Pump pit blocked	433	441	449	457
Error opening valve	434	442	450	458
Error closing valve	435	443	451	459
Valve error	436	444	452	460
P.P. blocked by valve	437	445	453	461
Not used	438	446	454	462
Not used	439	447	455	463
High level	464	472	480	488
Low level	465	473	481	489
Back-up start	466	474	482	490
High level float	467	475	483	491
Overflow	468	476	484	492
High inflow	469	477	485	493
Low inflow	470	478	486	494
Not used	471	479	487	495

**2.1.8 Comb alarm status:**

	IO-bit	Octal	Hexadecimal
Not ackn. A-Alarm	496	760	1F0
Not ackn B-Alarm	497	761	1F1
Not ackn. C-Alarm	498	762	1F2
Active A-Alarm	504	770	1F8
Active B-Alarm	505	771	1F9
Active C-Alarm	506	772	1FA
Ackn Alarm call	511	777	1FF

Same as ackn to reg.333  
0=PCx disconnects line,  
1=System disconnects line.

**2.1.9 Free user area:**

Can be used freely for ex. for remote communication or own Comli/Modbus flags. IO-bit 512-799.

**2.1.10 Checkrun (F.707):**

Pump	P1	P2	P3	P4	P5	P6	P7	P8	P9	P10	P11	P12	P13	P14	P15	P16
Pump, Check if running	800	801	802	803	804	805	806	807	808	809	810	811	812	813	814	815
Pump valve, Check run.	816	817	818	819	820	821	822	823	824	825	826	827	828	829	830	831

**2.1.11 Shift motor:**

Shift motor	1	2	3	4
End position MIN	864	880	832	848
End position MAX	865	881	833	849

**2.1.12 User IO:**

Reserved for user IO  
IO 960-967

**2.1.13 Status sequential week timer:**

Status sequence channel 1-8                    976-983

**2.1.14 System info:**

	IO-bit	Octal	Hexadecimal
Ackn. Personal alarm	992	1740	3E0
Outer personal alarm ON	993	1741	3E1
Local mode	994	1742	3E2
Modem error	995	1743	3E3
Telephone error	996	1744	3E4
Configuration Error	1000	1750	3E8

**2.1.15 Alarm status:**

	IO-bit	Octal	Hexadecimal
Alarm 1=IO 1024 and so on	1024-2047	2000-3777	400-7FF

Alarm status indicates 1 if alarm is active and 0 when alarm is off, independent of alarm type (A, B or C-Alarm).  
Alarm numbers, which are set to "Inactive", always show 0. For more info see System manual for PCx.

**2.1.16 Latchad alarm status:**

Alarm 1=IO 2048 and so on	2048-3071	4000-5777	800-BFF
---------------------------	-----------	-----------	---------

Latched alarm status is set to 1 when a alarm goes active and are updated after Comli/Modbus readout with actual alarm status. This is made not to loose alarms, which have gone inactive before the call is ready.

**2.1.17 Acknowledged alarms:**

Alarm 1=IO 3072 and so on	3072-4095	6000-7777	C00-FFF
---------------------------	-----------	-----------	---------

Status for acknowledged alarms are set to 0 each time a new alarm occurs and gives the possibility for a central system to acknowledge each alarm individually.

The acknowledgement works the same way as local acknowledgement on PCx and is made by writing a 1 to actual alarm bit. This acknowledgement is time stamped in the local alarm list if the alarm is not acknowledged earlier (Only 1 ackn./alarm can be time stamped).

Even local ackn. In sub station ackn actual IO-bits.

If you don't want to ackn. Each alarm individually the system can ackn. All alarms when the system ackn. To alarm call (write to reg. 333). See paragraph. 818 in manual.

For systems that handle the Comli telegram type for time stamped events (Å-Ä) we recommend that this is used for readout of new alarms.

**2.1.18 Copies of Bitmask register for AquaProg:****2.1.19 Time stamp of IO-event**

Comli IO 0-1023 (0=OFF 1=ON). IO 4096 controls time stamp of IO 0 and so on

IO-bit	Octal	Hexadecimal
4096-5119	10000-11777	1000-13FF

**2.1.20 Trig of Com. master communication**

Communication trig when changed status on IO 0-1023 (0=OFF 1=ON). IO 5120 controls trig on IO 0 and so on

IO-bit	Octal	Hexadecimal
5120-6143	12000-13777	1400-17FF

**2.1.21 Pump blocking at not ackn. Pump error alarms.**

IO number for config. of blocking conditions. 0=No blocking 1=Block until alarm is ackn.

Alarm conditions:	P1	P2	P3	P4	P5	P6	P7	P8	P9	P10	P11	P12	P13	P14	P15	P16
High motor current	6144	6152	6160	6168	6176	6184	6192	6200	6208	6216	6224	6232	6240	6248	6256	6264
Low motor current	6145	6153	6161	6169	6177	6185	6193	6201	6209	6217	6225	6233	6241	6249	6257	6265
Fallen motor protector	6146	6154	6162	6170	6178	6186	6194	6202	6210	6218	6226	6234	6242	6250	6258	6266
Fallen temp. protector	6147	6155	6163	6171	6179	6187	6195	6203	6211	6219	6227	6235	6243	6251	6259	6267
Low pump capacity	6148	6156	6164	6172	6180	6188	6196	6204	6212	6220	6228	6236	6244	6252	6260	6268
Running indication missing	6149	6157	6165	6173	6181	6189	6197	6205	6213	6221	6229	6237	6245	6253	6261	6269
Not used	6150	6158	6166	6174	6182	6190	6198	6206	6214	6222	6230	6238	6246	6254	6262	6270
Not used	6151	6159	6167	6175	6183	6191	6199	6207	6215	6223	6231	6239	6247	6255	6263	6271

**2.1.22 Setting of new IO status for sequential clock.**

Configuration of new IO status for sequential events. (as bitmask on reg. 11792-11795)

	IO-bit	Octal	Hexadecimal
Sequential event 1-64	6272-6335	14200-14277	1880-18BF

**2.2 Cross reference:**

IO 0 - 511 can be set into a cross-reference table to collect used IO to an effective Comli/modbus telegram. This means that that for ex. reading of IO 1 can be set to correspond IO 64 (pump running ind. P1) according to specification above.

If you are uncertain that cross reference is active, all IO are mirrored without influence on the cross reference list from IO 8192 and forward (IO 8192=IO 0, IO 8193=IO 1 and so on).

When different systems can be in contact with the sub stations it is recommended that an offset of 8192 generally is added to the IO number when setting up the system if cross reference is not used in the system.

Text add.(Hex)	Description	Scale factor / unit / note
----------------	-------------	----------------------------

### **2.3 Text addresses:**

All text addresses are given in Hex format.

Address (Hex): TEXT (module no: io no)

### 3.1.8 Information about analogue log data

224	Channel index (signal id)	Written by master
225	Block index (day)	Written by master
226	16/32 bit log data	
227	No of values in block	
228	Size of block	
229	No of data blocks	
230	Log. interval	sec
231	Log mode	0=OFF, 1=Current, 2=Average, 3=Min., 4=Max.
232	No of values in block	Reg. 232-236 only for
233	Size of block	UCP/UCC compatible 16-bit log data
234	No of data blocks	
235	Log. interval	sec
236	Log mode	0=OFF, 1=Current, 2=Average, 3=Min., 4=Max.
237	Decimal count	

### 3.1.9 Reserved for data from UCP/UCC

241	UCP/UCC A.in 1	0.001 mA
242	UCP/UCC A.in 2	0.001 mA
243	UCP/UCC A.in 3	0.001 mA
244	UCP/UCC A.in 4	0.001 mA
245	UCP/UCC A.in 5	0.001 mA
246	UCP/UCC A.in 6	0.001 mA
247	UCP/UCC A.out 1	0.001 mA
248	UCP/UCC A.out 2	0.001 mA

### 3.1.10 Local signal to UCPCOM

255	Fixed value	Always returns 1
-----	-------------	------------------

### 3.1.11 No of pumps running

258	No of pumps running in pump pit 1
259	No of pumps running in pump pit 2
260	No of pumps running in pump pit 3
261	No of pumps running in pump pit 4

### 3.1.12 Current motor speed for PID controlled pump groups

262	RPM PG.1	0.1 %
263	RPM PG.2	0.1 %

### 3.1.13 Analogue inputs in engineering units, according to A.in. set-up

264 + 265	Analogue in 1 IO-module 1	Range according to A.in. set-up
266 + 267	Analogue in 2 IO-module 1	Range according to A.in. set-up
268 + 269	Analogue in 3 IO-module 1	Range according to A.in. set-up
270 + 271	Analogue in 4 IO-module 1	Range according to A.in. set-up
272 + 273	Analogue in 1 IO-module 2	Range according to A.in. set-up

### 3.1.36 Cross reference list for Data registers with scale factors.

Divide scale factor with 2 for real value (Bit 0=sign flag, 1-15=scale factor)

2560	Cross reference for Data register 0
2561	Scale factor and sign flag for Data register 0
2562	Cross reference for Data register 1
2563	Scale factor and sign flag for Data register 1
2564	Cross reference for Data register 2
2565	Scale factor and sign flag for Data register 2
2566	Cross reference for Data register 3
2567	Scale factor and sign flag for Data register 3
2568	Cross reference for Data register 4
2569	Scale factor and sign flag for Data register 4
2570	Cross reference for Data register 5
2571	Scale factor and sign flag for Data register 5
2572	Cross reference for Data register 6
2573	Scale factor and sign flag for Data register 6
2574	Cross reference for Data register 7
2575	Scale factor and sign flag for Data register 7
2576	Cross reference for Data register 8
2577	Scale factor and sign flag for Data register 8
2578	Cross reference for Data register 9
2579	Scale factor and sign flag for Data register 9
2580	Cross reference for Data register 10
2581	Scale factor and sign flag for Data register 10
2582	Cross reference for Data register 11
2583	Scale factor and sign flag for Data register 11
2584	Cross reference for Data register 12
2585	Scale factor and sign flag for Data register 12
2586	Cross reference for Data register 13
2587	Scale factor and sign flag for Data register 13
2588	Cross reference for Data register 14
2589	Scale factor and sign flag for Data register 14
2590	Cross reference for Data register 15
2591	Scale factor and sign flag for Data register 15
2592	Cross reference for Data register 16

<b>Register no</b>	<b>Description</b>	<b>Scale factor / unit / note</b>

### 3.1.49 Configuration digital in IO module 1-8

#### 3.1.49.1 Configuration digital in IO module 1 D.IN 1

6784	Digital in type	
6785	Object number	Pump reference etc.
6786	Normally Open/Closed	0=NO, 1=NC
6787	Local / Remote IO	0=Terminal, 1=IO-bit
6788	IO-bit no for non local input	
6789	Parameter 1	Additional configuration for some IO-functions
6790	Parameter 2	See appendices about D.IN types
6791	Parameter 3	

#### 3.1.49.2 Configuration digital in IO module 1 D.IN 2

6792	Digital in type	
6793	Object number	Pump reference etc.
6794	Normally Open/Closed	0=NO, 1=NC
6795	Local / Remote IO	0=Terminal, 1=IO-bit
6796	IO-bit no for non local input	
6797	Parameter 1	Additional configuration for some IO-functions
6798	Parameter 2	See appendices about D.IN types
6799	Parameter 3	

#### 3.1.49.3 Configuration digital in IO module 1 D.IN 3

6800	Digital in type	
6801	Object number	Pump reference etc.
6802	Normally Open/Closed	0=NO, 1=NC
6803	Local / Remote IO	0=Terminal, 1=IO-bit
6804	IO-bit no for non local input	
6805	Parameter 1	Additional configuration for some IO-functions
6806	Parameter 2	See appendices about D.IN types
6807	Parameter 3	

<b>Register no</b>	<b>Description</b>	<b>Scale factor / unit / note</b>
3.1.49.4	Configuration digital in IO module 1 D.IN 4	
6808	Digital in type	
6809	Object number	Pump reference etc.
6810	Normally Open/Closed	0=NO, 1=NC
6811	Local / Remote IO	0=Terminal, 1=IO-bit
6812	IO-bit no for non local input	
6813	Parameter 1	Additional configuration for some IO-functions
6814	Parameter 2	See appendices about D.IN types
6815	Parameter 3	
3.1.49.5	Configuration digital in IO module 1 D.IN 5	
6816	Digital in type	
6817	Object number	Pump reference etc.
6818	Normally Open/Closed	0=NO, 1=NC
6819	Local / Remote IO	0=Terminal, 1=IO-bit
6820	IO-bit no for non local input	
6821	Parameter 1	Additional configuration for some IO-functions
6822	Parameter 2	See appendices about D.IN types
6823	Parameter 3	
3.1.49.6	Configuration digital in IO module 1 D.IN 6	
6824	Digital in type	
6825	Object number	Pump reference etc.
6826	Normally Open/Closed	0=NO, 1=NC
6827	Local / Remote IO	0=Terminal, 1=IO-bit
6828	IO-bit no for non local input	
6829	Parameter 1	Additional configuration for some IO-functions
6830	Parameter 2	See appendices about D.IN types
6831	Parameter 3	
3.1.49.7	Configuration digital in IO module 1 D.IN 7	
6832	Digital in type	
6833	Object number	Pump reference etc.
6834	Normally Open/Closed	0=NO, 1=NC
6835	Local / Remote IO	0=Terminal, 1=IO-bit
6836	IO-bit no for non local input	
6837	Parameter 1	Additional configuration for some IO-functions
6838	Parameter 2	See appendices about D.IN types
6839	Parameter 3	
3.1.49.8	Configuration digital in IO module 1 D.IN 8	
6840	Digital in type	
6841	Object number	Pump reference etc.
6842	Normally Open/Closed	0=NO, 1=NC
6843	Local / Remote IO	0=Terminal, 1=IO-bit
6844	IO-bit no for non local input	
6845	Parameter 1	Additional configuration for some IO-functions
6846	Parameter 2	See appendices about D.IN types
6847	Parameter 3	
3.1.49.9	Configuration digital in IO module 1 D.IN 9	
6848	Digital in type	
6849	Object number	Pump reference etc.
6850	Normally Open/Closed	0=NO, 1=NC

<b>Register no</b>	<b>Description</b>	<b>Scale factor / unit / note</b>
6851	Local / Remote IO	0=Terminal, 1=IO-bit
6852	IO-bit no for non local input

### 3.1.53 Additional set-up main menu (see also reg. 11574 for toggle set-up)

8992	Flow unit row/value 1	0=l/s, 1=m3/h
8993	Decimal count row/value 1	(For register data)
8994	Flow unit row/value 2	0=l/s, 1=m3/h
8995	Decimal count row/value 2	(For register data)
8996	Flow unit row/value 3	0=l/s, 1=m3/h
8997	Decimal count row/value 3	(For register data)
8998	Flow unit row/value 4	0=l/s, 1=m3/h
8999	Decimal count row/value 4	(For register data)

### 3.1.54 Analogue log set-up log channel 0-19

#### 3.1.54.1 Analogue log set-up log channel 0

9000	Open for configuration	Write 1
------	------------------------	---------

Register no	Description	Scale factor / unit / note
9001	Log mode	0=Off, 1=Current, 2=Average, 3=Min, 4=Max
9002	Log interval	sec (2 - 21600)
9003	Resolution 16 / 32 data bits	0=32 bits, 1=16 bits
9004	Signal type	See appendices about signal types
9005	Signal index	0 - Max signal index
9006	Unit option (for flow)	0=l/s, 1=m3/h
9007	Start register for expanded data	
9008	Decimal count	(For register data)
9009	Complete new config.	Write 2

### 3.1.54.2 Analogue log set-up log channel 1

9010	Open for configuration	Write 1
9011	Log mode	0=Off, 1=Current, 2=Average, 3=Min, 4=Max
9012	Log interval	sec (2 - 21600)
9013	Resolution 16 / 32 data bits	0=32 bits, 1=16 bits
9014	Signal type	See appendices about signal types
9015	Signal index	0 - Max signal index
9016	Unit option (for flow)	0=l/s, 1=m3/h
9017	Start register for expanded data	
9018	Decimal count	(For register data)
9019	Complete new config.	Write 2

### 3.1.54.3 Analogue log set-up log channel 2

9020	Open for configuration	Write 1
9021	Log mode	0=Off, 1=Current, 2=Average, 3=Min, 4=Max
9022	Log interval	sec (2 - 21600)
9023	Resolution 16 / 32 data bits	0=32 bits, 1=16 bits
9024	Signal type	See appendices about signal types
9025	Signal index	0 - Max signal index
9026	Unit option (for flow)	0=l/s, 1=m3/h
9027	Start register for expanded data	
9028	Decimal count	(For register data)

## 4 Appendices

### 4.1 Scalable cross reference:

Register 0-254 (telegram type 0 and 2) can be defined to hold preferred data by a cross reference table.

The extended Comli telegram (max 65535 reg.) is not affected by the cross-reference.

Together with the cross reference table there is a possibility to set an individual scale factor between 0 and 32767, for each position in the cross-reference list.

When reading data, the value is divided with corresponding scale factor. When writing data the value will be multiplied with corresponding scale factor.

Scale factor is ignored when set to 0.

(ex. running time in seconds is converted to minutes with scale factor 60 ).

For data in double registers (32 bits), the highest register number should be used together with scale factors.

Writing to the highest double register number will also set data in the lower register number if scale factor is set.  
If scale factor is set to zero, each register is handled individually.

Many registers allow negative values (signed 2-complement data). This can cause some systems to treat negative data as large positive numbers (ex. -1 is read as 65535 by the system).

To avoid this to cause problems there is a possibility to individually set cross reference registers to only positive data.  
Negative values will give zero readout.

### 4.2 Alarm acknowledgement for pump restart:

In some applications it is preferred to not automatically restart a pump before relevant alarms are acknowledged.  
Following alarms can be set to block the pump until alarm is acknowledged.

High motor current.

Low motor current.

Motor protection.

High temperature

Low pump capacity

Run indication fail.

The configuration is done individually for each alarm. Further a valve error can be set for pump blocking.  
Note !! Valve blocking is made even if alarm type is not set (A,B,C) .

To restart the running of the pumps the actual alarm is reset manually on the PCx or via Comli/Modbus.

Combined alarm for "Pump alarm blocked". When acknowledging combined alarm "Pump alarm blocked" all not acknowledged alarms which are set to block actual pump are reset incl. blocking by valve error.

For Comli/Modbus there is a pump related indication of alarm blocking on IO 928-943 (P1-P16). Writing to these IO resets all actual pump alarms, which can cause blocking. The combined alarm "Pump(s) alarm blocked" is not acknowledged in this case.

Pump pit related indication that one or more pumps in the pit are alarm blocked is on IO 408-411 (PP.1 - PP.4). Writing to these IO resets actual alarms for all pumps, which belong to the pump pit, and resets ev. blocking from common Pump pit valve.

### 4.3 Unit identification:

Identification of hard and software is in register 445.

17=PCx

Register no	Description	Scale factor / unit / note

**4.4 Digital input types:**

Type no.	Function	Object no. (Index area)
0	Closed	
1	High float Pump pit	1-4
2	Overflow Pump pit	1-4
3	Running indication pump	1-16
4	Motor protector pump	1-16
5	Temp protector pump	1-16
6	Block pump	1-16
7	Block Pump pit	1-4
8	End position valve open	1-16 + 17-20 for pump pit valves
9	End position valve closed	1-16 + 17-20 for pump pit valves
10	Pulse input (Rain, Flow, Energy)	1-8
11	Alarm input free choice.	-
12	Personal alarm (Visit and local indication)	-
13	External Personal alarm.	-
14	Start float.	1-16 + 17-20 for Pump pit
15	Stop float.	1-16 + 17-20 for Pump pit
16	Block PID controller	1-2
17	Block output	0-63 (IO-no)
18	Activate output	0-63 (IO-no)
19	Shift motor Max (end position)	1-4
20	Shift motor Min (end position)	1-4
21	Block Shift motor	1-4
22	Force Shift motor	1-4
23	Block Pump start.	1-16 + 17-20 for Pump pit
24	Block derivata control	1-4 (Pump pit)
25	Power Alarm	1-8 (IO-module)

Register no	Description	Scale factor / unit / note

#### 4.5 Digital output types:

Type no.	Function	Object no. (Index area)
0	Closed	
1	Pump	1-16
2	Valve control	1-16 + 17-20 for Pump pit valves
3	Open valve	1-16 + 17-20 for Pump pit valves
4	close valve	1-16 + 17-20 for Pump pit valves
5	Run. Ind. Pump pit	1-4
6	Signal not ackn. alarm	1-7 (Bit mask A, B and C alarm)
7	Selective alarm output ( Conditional output for alarms )	
8	Remote controlled output	
9	Signal personal alarm: visit timer passed	
10	Signal active alarm	1-7 (Bit mask A, B and C alarm)
11	Alarm impulse new alarm	1-7 (Bit mask A, B and C alarm)
12	Reset Motor protector	1-16 + 17-20 for Pump pit reference
13	Pump reversing	1-16
14	Spraying (pre select on stop counter)	1-16 + 17-20 for Pump pit reference
15	Comli IO-bit (Indication/Pulse for free IO)	0-4095
16	Logic IO (Conditional output for 1-6 IO no.)	
17	Pre set pulse flow meter	1-4
18	Pre set pulse counter	1-8
19	Pre-set pulse pit flow	1-4
20	Timer	0-9 (0=free running, 1-4 = Pump pit, 5-8=Free, 9=Week timer)
21	Set point	Signal choice like Analogue output types
22	Speed controlled pump	1-16
23	Shift motor increase	1-4
24	Shift motor decrease	1-4
25	Compare register data	
26	Set-point window	Signal choice like Analogue output types
27	Modem Power	1-2 (COM 1-2)

#### 4.6 Analogue input types:

Type no.	Function	Object no. (Index area)
0	Closed	
1	Motor current pump	1-16
2	Free choice input	
3	Level sensor Pump pit	0-4, (0=General 1-4 pump pit 1-4)
4	Level sensor channel flow	5-8 Flow meter 1-4
5	Level sensor overflow	1-4 (Pump pit 1-4)
6	Flow meter	5-8 (Flow meter 1-4)
7	Pressure out	0-4, (0=general, 1-4=pump group)
8	Pressure suction side	0-4, (0=general, 1-4=pump group)

NOTE! For type 4 and 6 totally 4 flow meter channels are available

Register no	Description	Scale factor / unit / note
-------------	-------------	----------------------------

#### **4.7 Analogue output types:**

These types are the same for Analogue logger, mA output and signal indication on display.  
NOTE! Object no. for Analogue output types has base 0.

Type no.	Function	Object no. (Index areas)
0	Level in Pump pit	0-3 (Pump pit 1-4)
1	Inflow Pump pit	0-3 (Pump pit 1-4)
2	Outflow Pump pit	0-3 (Pump pit 1-4)
3	Overflow Pump pit	0-3 (Pump pit 1-4)
4	Flow meter	4-7 (Flow meter 1-4)
5	Overflow level Pump pit	0-3 (Pump pit 1-4)
6	Level (channel) flow meter	4-7 (Flow meter 1-4)
7	Analogue value for Pulse channel	0-7 (Pulse channel 1-8)
8	Input on IO-module 1	0-3 (AI 1-4)
9	Input on IO-module 2	0-3 (AI 1-4)
10	Input on IO-module 3	0-3 (AI 1-4)
11	Input on IO-module 4	0-3 (AI 1-4)
12	Input on IO-module 5	0-3 (AI 1-4)
13	Input on IO-module 6	0-3 (AI 1-4)
14	Input on IO-module 7	0-3 (AI 1-4)
15	Input on IO-module 8	0-3 (AI 1-4)
16	Temperature signal on IO-module 1	0-3 (AI 1-4 for ultrasonic)
17	Comli register	0-12287
18	Controller signal PID controller	0-1
19	Speed PID controlled pump	0-1
20	Pressure (Out)	0-3 (Pump group 1-4)
21	Pressure Suction side	0-3 (Pump group 1-4)
22	Volume	0-3 (Pump pit 1-4)

#### **4.8 Digital output parameters**

##### **4.8.1 Parameters for digital output function "Selective alarm output" (Type 7)**

Parameter 1	Alarm number 1	0=Ignore
Parameter 2	Alarm number 2	0=Ignore
Parameter 3	Alarm number 3	0=Ignore
Parameter 4	Alarm number 4	0=Ignore
Parameter 5	Alarm number 5	0=Ignore
Parameter 6	Alarm number 6	0=Ignore
Parameter 7	Condition for multiple alarm numbers (OR , AND) 0=OR, 1=AND	

##### **4.8.2 Parameters for digital output function "Remote controlled output" (Type 8)**

Parameter 1	On time	0-5999 sec. (99 min, 59 sec)
-------------	---------	------------------------------

##### **4.8.3 Parameters for digital output function "Alarm pulse" (Type 11)**

Parameter 1	Pulse time	0-5999 sec. (99 min, 59 sec)
-------------	------------	------------------------------

##### **4.8.4 Parameters for digital output function "Reset motor protection" (Type 12)**

Parameter 1	Pulse time	0-99 sec.
Parameter 2	Pause time	0-999 sec.
Parameter 3	Max. no of retries	1-3

##### **4.8.5 Parameters for digital output function "Reverse pump" (Type 13)**

Parameter 1	Reverse timed	0-999 sec.
Parameter 2	Pause time	0-999 sec.
Parameter 3	Pump relay Off/On during reverse	0=Off, 1=On

<b>Register no</b>	<b>Description</b>	<b>Scale factor / unit / note</b>
4.8.6	Parameters for digital output function "Spray" (Type 14)	
Parameter 1	Spray (flush) time	0-5999 sec.
Parameter 2	No of pump starts/stops between spray	0-99
Parameter 3	Spray on start or stop	0=Stop, 1=Start
4.8.7	Parameters for digital output function "Comli IO-bit" (Type 15)	
Parameter 1	Pulse time / Off delay	0-5999 sec.
Parameter 2	Block on unackn. alarm	0=Off, 1=On
Parameter 3	Select pulse or off delay.	0=Pulse output, 1=Off delay
Parameter 4	On delay	0-5999 sec.
4.8.8	Parameters for digital output function "Logic IO" (Type 16)	
Parameter 1	1:st Comli IO-no	0-4095, -1 (65535) = Inactive
Parameter 2	2:nd Comli IO-no	0-4095, -1 (65535) = Inactive
Parameter 3	3:rd Comli IO-no	0-4095, -1 (65535) = Inactive
Parameter 4	4:th Comli IO-no	0-4095, -1 (65535) = Inactive
Parameter 5	5:th Comli IO-no	0-4095, -1 (65535) = Inactive
Parameter 6	Bit mask normal/inverted signal	0=Inverted, 1=normal (Bit 0-4 = Signal 1-5)
Parameter 7	Logic condition	0=OR ON, 1=AND ON, 2=OR OFF, 3=AND OFF
4.8.9	Parameters for digital output function "Flow pulse from flow meter" (Type 17)	
Parameter 1	Pulse time	0-99 sec.
Parameter 2	Pre select volume/pulse	0.1 m3
4.8.10	Parameters for digital output function " Flow pulse from pulse flow " (Type 18)	
Parameter 1	Pulse time	0-99 sec.
Parameter 2	Pre select volume/pulse	0.1 accumulated unit
4.8.11	Parameters for digital output function " Flow pulse from pump flow " (Type 19)	
Parameter 1	Pulse time	0-99 sec.
Parameter 2	Pre select volume/pulse	0.1 m3
4.8.12	Parameters for digital output function "Timer" (Type 20)	
Parameter 1	Pulse time / Delay, Normal time	0-59999 sec.
Parameter 2	Pause time / Delay, Night time	0-59999 sec.
Parameter 3	Pulse / Timer status	0=Status night time, 1=Pulse at night time, 2=Pulse at normal time, 3=Pulse Normal and night time
4.8.13	Parameters for digital output function "Set point" (Type 21)	
Parameter 1	On delay	0-5999 sec.
Parameter 2	Object index for analogue signal	0- (Object type is specified in general reg. for object no)
Parameter 3	Select unit	0=standard unit, 1=alternate unit (For some signals)
Parameter 4	Set point on	High 16 bits (MSW)
Parameter 5	Set point on	Low 16 bits (LSW)
Parameter 6	Set point off	High 16 bits (MSW)
Parameter 7	Set point off	Low 16 bits (LSW)
4.8.14	Parameters for digital output function "Speed pump" (Type 22)	
Parameter 1	Control the pump run with this contact	0=No, 1=Yes (ordinary pump relay is blocked when pump is connected to freq. converter)

<b>Register no</b>	<b>Description</b>	<b>Scale factor / unit / note</b>
<b>4.8.15 Parameters for digital output function "Compare register data" (Type 25)</b>		
Parameter 1	Type of comparison	0=R.1<R.2, 1=R.1<=R.2, 2=R.1=R.2, 3=R.1>=R.2, 4=R.1>R.2
Parameter 2	Data register 1	0-65535
Parameter 3	Data register 2	0-65535
<b>4.8.16 Parameters for digital output function "Setpoint window" (Type 26)</b>		
Parameter 1	On delay	0-5999 sec.
Parameter 2	Object index for analogue signal	0- (Object type is specified in general reg. for object no)
Parameter 3	Select unit	0=standard unit, 1=alternate unit (For some signals)
Parameter 4	Set point Max	High 16 bits (MSW)
Parameter 5	Set point Max	Low 16 bits (LSW)
Parameter 6	Set point Min	High 16 bits (MSW)
Parameter 7	Set point Min	Low 16 bits (LSW)

## **4.9 Digital input parameters**

### **4.9.1 Parameters for digital input function "Hold output" (Type 17)**

Parameter 1	IO-Module no.	1-8
Parameter 2	D.OUT no to block	1-8

### **4.9.2 Parameters for digital input function "Force output" (Type 18)**

Parameter 1	IO-Module no.	1-8
Parameter 2	D.OUT no to block	1-8

### **4.9.3 Parameters for digital input function "Block derivata control" (Type 24)**

Parameter 3	Type of blocking.	1-3 (1=start, 2=stop, 3=start and stop)
-------------	-------------------	---
